# Gas supply status report

### As at: 1pm, 13 January 2023

- Since 23 June 2022 the alert level of the gas emergency plan has been in place. The Bundesnetzagentur is monitoring the situation carefully and is in close contact with the system operators.
- The gas supply in Germany is stable. The security of supply is safeguarded. Overall, the Bundesnetzagentur views the situation as less tense than at the beginning of the winter. A gas deficit situation this winter is becoming increasingly unlikely. However, a worsening of the situation can still not be ruled out. The need to save gas is still important.
- Changes in imports from Norway may be noticeable from 12 to 17 January 2023 owing to repairs at a compressor station. As the repair work is only expected to take a short amount of time and temperatures are currently mild, the Bundesnetzagentur does not expect any negative impact on security of supply. The reduction in imports will also be relatively small and can be partially made up for from other sources.
- Gas is mainly being taken out of storage. The total storage level in Germany is 90.73%. The storage level at the Rehden facility is 90.33%.
- Gas consumption in the week beginning 2 January 2023 was 38% below the average consumption for 2018 to 2021 and 8% higher than in the previous week. Temperatures were 5.1°C higher than in the previous years.
- The temperature-adjusted consumption in the weeks beginning 26 December 2022 and 2 January 2023 was 25% lower than the reference value for 2018 to 2021 and thus back at a stable level.
- Wholesale prices have decreased again recently, but still remain at relatively high levels. Businesses and private consumers must continue to adapt to a significantly higher price level.
